PROFILE

Platform Engineer with deep Odoo experience. I adapt platforms, integrations, and workflows so their rules, state, and boundaries are clear enough to trust.

SELECTED ENGINEERING EVIDENCE

Multi-Company HRIS

Designed and implemented most core HR workflows—including Attendance, Recruitment, and Payroll—and the dashboard within a broader cross-functional delivery. One shared Odoo deployment connected approved attendance, overtime, and leave records to traceable payslip calculations while preserving company-specific permissions and rules.

Payment Provider Module

Built a complete Odoo extension for a client-required regional payment provider, including checkout behavior, verified webhook handling, transaction-state mapping, and duplicate-safe updates.

AI Odoo R&D

Explored a working internal prototype for Odoo-grounded conversational workflows. Retrieval applied Odoo access rules before searching records, and missing evidence returned a safe fallback rather than an invented answer.

TECHNICAL PRACTICE

Odoo modules, ORM, OWL, QWeb, multi-company workflows, operational reporting, REST APIs, webhooks, transaction state, Python, JavaScript, PostgreSQL, Linux, Docker, Bash, and Git.

WORKING METHOD

- Trace the people, records, approvals, and outcomes an operation must support.
- Make permissions, company rules, external ownership, and confidentiality explicit.

- Design failure paths for retries, invalid state, and missing context.
- Validate behavior against representative scenarios and expected operational outcomes.
